

MetaCell® IncreaSect 900 Chemically Defined Medium

User Manual

Product Description

MetaCell® IncreaSect 900 is a serum-free insect cell culture medium designed to support high-density suspension cultures of Sf9 insect cells, specifically for use in baculovirus expression systems. The complete MetaCell® IncreaSect 900 medium consists of three components:MetaCell® IncreaSect 900, CD Lipid Concentrate A, and MetaCell® Glycerin, which are used in a ratio of 1:1:1000, respectively.

MetaCell® IncreaSect 900 contains 12mM L-glutamine.

This product is intended for research or further manufacturing but not for human or therapeutic use.

Product Name	Cat No.	Form	Size	Storage	Shelf Life	Application
MetaCell®	L3200-1000	Liquid	1000mL	2-8°C, protected	12 months	high-density suspension

Cell Culture Conditions

Basal medium: MetaCell® IncreaSect 900 Application: Suspension cell culture

Cell line: Sf9

Recommended set-up for initial trials:

Vessel volume	125mL	250mL	500mL		
Medium volume	25-35	60-70	120-140		
Shaker speed	125±5 rpm (amplitude 19mm) 120± 5 rpm (amplitude 25mm)				
	95± 5 rpm (amplitude 50mm)				
Types of flasks	PETG or PC, breathable, without baffles				
Culture environment	$27 \pm 0.5 ^{\circ}\mathrm{C}$, 0% CO_{2} , no additional humidity is required.				
	Ensure proper gas exchange and minimize light exposure during cultivation				

General instructions

Powdered media are hygroscopic and should be protected from moisture. The entire contents of each package should be used immediately after opening. Preparing a concentrated solution of medium is not recommended as precipitates may form.

Cell Recovery

- 1. Cells transported on dry ice should be placed in a liquid nitrogen environment for 3-7 days before cell recovery.
- 2. Remove a vial of cryopreserved cells from the liquid nitrogen storage tank and place it in a 37°C water bath for rapid thawing (1-2 minutes). Take out the vial when the ice block inside is almost completely melted.

Cellplus Biotechnology (Suzhou) Co., Ltd.

- 3. Determine whether centrifugation is required upon the original characteristics of the cells:
 - (1) If centrifugation is required: pre-heat 29 mL of MetaCell® IncreaSect 900 for over 30 minutes. Mix 9 mL of the pre-heated medium with the cell suspension in a centrifuge tube. Centrifuge at 200 × g for 5 minutes and discard the supernatant. Resuspend the cell pellet in the pre-heated MetaCell® IncreaSect 900. Transfer the entire resuspended solution to a 125 mL shake flask to achieve a final volume of 20 mL. Mix thoroughly and check cell density and viability; the target density should be within the range of 1.2-1.3 × 10⁶ cells/mL.
 - (2) If centrifugation is not required (e.g., for ExpiSf9TM Cells): Gently mix the cell suspension in the cryovial by pipetting. Transfer the entire cell suspension into a 125 mL shake flask containing pre-heated MetaCell® IncreaSect 900, ensuring a final culture volume of 20 mL.
- 4. Place the shake flask on a cell culture shaker with recommended parameters set at 27°C, 0% CO_2 , and 95 \pm 5 rpm (with an amplitude of 50 mm).
- 5. When the cell viability is ≥95%, proceed with subculture. It is recommended to perform at least three passages before conducting subsequent experiments.

Cell Passaging

- 1. Based on the cell count results, seed Sf9 cells at a density of $0.9-1.1 \times 10^6$ cells/mL and passage them after 3 days of culture. Ensure that the cells are passaged at least 3 times before proceeding with subsequent experiments.
- 2. Once the suspension culture stabilizes, cells should be cryopreserved as soon as possible. Typically, seeding SF9 cells at a density of $0.9-1.1 \times 10^6$ cells/mL results in a viable cell density of $5.0-7.0 \times 10^6$ cells/mL by day 3, with viability $\geq 95\%$.

Cell Cryopreservation

- 1. Prepare a sufficient number of cells in the early logarithmic growth phase with a cell viability ≥95% for cryopreservation.
- 2. The final cell concentration for cryopreservation should be adjusted to 25.0-28.0×10⁶ cells/mL.
- 3. Pre-cool the cryopreservation solution (90% MetaCell® IncreaSect 900 + 10% DMSO) at 2-8°C for at least 30 minutes.
- 4. Take an appropriate amount of cell suspension, centrifuge at 200×g for 5 minutes, discard the supernatant, and resuspend the cells in the pre-cooled cryopreservation solution.
- 5. Divide the cell suspension into cryotubes according to the cryopreservation specifications.
- 6. Gradually cool the cells to -80°C for freezing (cooling rate of 1°C/min) using a controlled-rate freezer or manual control method.
- 7. After 24 hours, transfer the frozen cells to the vapor phase of a liquid nitrogen tank (storage temperature range: -200°C to -125°C) for storage.

Cell Adaptation

In most cases, serum-free cultured Sf9 cells can be directly adapted to MetaCell® IncreaSect 900. If direct replacement of the medium (direct adaptation) fails, it is recommended to use gradient replacement (indirect adaptation) to adapt Sf9 cells to MetaCell® IncreaSect 900.

Note: Sf9 cells used for adaptation need to be in the early logarithmic growth phase, with a cell viability≥90%.

Direct Adaptation Method

For Sf9 cells that can be directly adapted, when the cell viability is \geq 90% and in the early logarithmic growth phase, try directly transferring from the current serum-free medium to MetaCell[®] IncreaSect 900.

- 1. Inoculate the cells into fresh MetaCell®IncreaSect 900 at a seeding density of 0.9-1.1×10⁶ cells/mL (refer to the cell passaging steps).
- 2. After 3-4 days of culture, check the cell density and viability. At this time, the cell viability should be ≥90%. If the viability is lower, use the indirect adaptation method described below.
- 3. Passage the cells for an additional 3-5 times, ensuring they are in good condition and growing normally, before proceeding with subsequent experiments.

Indirect Adaptation Method

- 1. Mix the original medium and MetaCell[®] IncreaSect 900 at a volume ratio of 75:25, and the seeding cell density should be $0.9-1.1 \times 10^6$ cells/mL.
- 2. Cells should be passaged when the cell density reaches $5.0-7.0 \times 10^6$ cells/mL after culturing for 3-4 days.
 - (1) If the cells grow well and the viability is ≥90%, adjust the ratio of MetaCell® IncreaSect 900 to the original medium to 50:50 during passaging.
 - (2) If the cells grow slowly, cells should be collected by centrifugation at 200×g for 5 minutes. Resuspended the cells in fresh mixed medium. The medium mix at this point still consists of MetaCell® IncreaSect 900 and the original medium at a ratio of 25:75.
 - 3. Repeat step 2 and gradually increase the ratio of MetaCell® IncreaSect 900 (50:50, 75:25) until 100% MetaCell® IncreaSect 900 is used for cell culture.
 - 4. Continue culturing the cells in 100% MetaCell[®] IncreaSect 900 for 2-3 passages. When the cell density reaches $5.0-7.0\times10^6$ cells/mL and the cell viability is \geq 90%, the adaptation is considered complete.
 - 5. Continue the passaging for at least 3 times. If the cell growth remains stable, subsequent experiments can be conducted.
